Sources of Market Power
Why Study Market Power?

- Most markets are imperfect to some degree
- Economists believe there is a role for government in easing market imperfections
- Today
  - How does limited competition impact consumption and production?
  - What is government’s role in improving competition?
What is Market Power?

- Market power $\equiv$ when a firm has the ability to influence the market price
- Monopoly $\equiv$ market served only by one firm
- Monopolist $\equiv$ sole supplier and price setter of good on the market
Where Does Market Power Come From?

What keeps prices low in competitive markets?

Inhibitions to entry include

1. “Natural” monopolies
2. Switching costs
3. Product Differentiation
4. Absolute Cost Advantages
5. Government barriers to entry
1. Natural Monopolies

• An industry in which average total cost is always decreasing
  • Note that this also implies decreasing marginal cost
• This means that it is efficient for one firm to produce the entire industry output
1. Natural Monopolies

- An industry in which average total cost is always decreasing
  - Note that this also implies decreasing marginal cost
- This means that it is efficient for one firm to produce the entire industry output

More on this at the end of class.
2. Switching Costs and Market Power

- Switching costs $\equiv$ cost to consumer in switching between products – examples?
- Network goods have particularly high switching costs
- Network good $\equiv$ good for which value to consumer increases with number of other consumers of the product

Product differentiation

- Imperfect substitutability across varieties of a product
- Observable if you are willing to pay a little more for a particular variant

Product differentiation

- Imperfect substitutability across varieties of a product
- Observable if you are willing to pay a little more for a particular variant

Absolute Cost Advantage

- Firm owns something or has a technology that makes it have lower costs relative to competitors
- Examples?
5. Government Regulation as a Barrier to Entry

- We’ve already given examples that limit entry – reprise?
5. Government Regulation as a Barrier to Entry

- We’ve already given examples that limit entry – reprise?
- Remember, over the long run, high profits are a temptation to entry, perhaps in a slightly altered form
5. Government Regulation as a Barrier to Entry

- We’ve already given examples that limit entry – reprise?
- Remember, over the long run, high profits are a temptation to entry, perhaps in a slightly altered form
- Don’t conclude that barriers to entry are always bad. They have a cost; does the cost justify the benefit?
Market Power and Marginal Revenue
Neither Perfect Competition Nor a Monopoly

- We say a firm has market power if it faces a downward sloping demand curve
  - Recollect – what did a demand curve look like to a perfectly competitive firm?
Neither Perfect Competition Nor a Monopoly

- We say a firm has market power if it faces a downward sloping demand curve
  - Recollect – what did a demand curve look like to a perfectly competitive firm?
- Firms in these types of markets face downward-sloping demand curves
  - Oligopoly ≡ an industry with few firms – examples?
  - Monopolistic competition ≡ many firms selling differentiated products
  - Monopoly
Marginal Revenue: Perfect Competition and Not

Perfect Competition

- What is marginal revenue?
Marginal Revenue: Perfect Competition and Not

Perfect Competition

• What is marginal revenue?
• If the firm perceives the demand curve as constant, then $MR = P$
Marginal Revenue: Perfect Competition and Not

Perfect Competition

• What is marginal revenue?
• If the firm perceives the demand curve as constant, then $MR = P$

Market Power

• We assume that the firm has to charge the same price for all units of the good
• As before, marginal revenue is the additional revenue from an additional unit of output sold
• However, selling an additional unit of output now requires lowering the price on all units of output
Market Power and Marginal Revenue in Pictures

Demand as Perceived by the Firm

Compare Gains and Losses From Change in Production
Market Power and Marginal Revenue in Algebra

Define

\[ MR = P + \frac{\Delta P}{\Delta Q} Q = \left( \frac{\partial TR}{\partial Q} \right) \]

- We know that \( \frac{\Delta P}{\Delta Q} \) is the slope of the demand curve, and that’s negative
- Thus, \( MR \) decreases as \( Q \) increases
Market Power and Marginal Revenue in Algebra

For a linear demand curve,

• Consider an inverse demand curve of form \( P = a + bQ \) (note similarity to \( y = b + mx \))

• We can rewrite \( MR \) as

\[
MR = P + \frac{\Delta P}{\Delta Q}Q \\
= (a + bQ) + bQ \\
= a + 2bQ
\]
Market Power and Marginal Revenue in Algebra

For a linear demand curve,

• Consider an inverse demand curve of form \( P = a + bQ \) (note similarity to \( y = b + mx \))

• We can rewrite \( MR \) as

\[
MR = P + \frac{\Delta P}{\Delta Q}Q \\
= (a + bQ) + bQ \\
= a + 2bQ
\]

• Note that the intercept is the same as the inverse demand curve, but the slope is twice as steep

• This is another formula you should memorize

Note: This is slightly different notation with signs than in the textbook; I find it clearer. Remember that \( b \) is negative, so the \( MR \) slope will always be negative.
Profit Maximization and Market Power
Profit Maximization

What does a competitive firm set equal for profit maximization?
Profit Maximization

What does a competitive firm set equal for profit maximization?

- $MR = MC$, and we know that $MR = P$
Profit Maximization

What does a competitive firm set equal for profit maximization?
- \( MR = MC \), and we know that \( MR = P \)

What does a firm with market power set equal for profit maximization?
- \( MR = MC \)
Profit Maximization

What does a competitive firm set equal for profit maximization?

- \( MR = MC \), and we know that \( MR = P \)

What does a firm with market power set equal for profit maximization?

- \( MR = MC \)
- But \( MR \) is more complicated
- And \( MR \neq P \) (in general)
Maximizing $\pi$ with Market Power: Constant $MC$

Where is $MR$?
Maximizing $\pi$ with Market Power: Constant $MC$

What is Profit Maximizing $Q$?
Maximizing $\pi$ with Market Power: Constant $MC$

What is Profit Maximizing $P$?

Diagram:
- Demand curve $D$
- Marginal Revenue curve $MR$
- Marginal Cost curve $MC$
- Output $Q^*$
- Price $P$
Maximizing $\pi$ with Market Power: Constant $MC$

Can See Revenues, but Not Costs
Maximizing $\pi$ with Market Power: Increasing $MC$

Where is Profit Maximizing $Q$?
Maximizing $\pi$ with Market Power: Increasing $MC$

What is Profit Maximizing $P$?
Maximizing $\pi$ with Market Power: Increasing $MC$

What is Total Revenue?
Maximizing $\pi$ with Market Power: Increasing $MC$  

What are Total Costs?
Maximizing $\pi$ with Market Power: Increasing $MC$

What is Profit?

![Diagram showing profit maximization with market power and increasing marginal cost.](image-url)
Maximizing $\pi$ with Market Power: Increasing $MC$

Market Power Yields Profits!

Diagram showing the relationship between price ($P$), quantity ($Q$), marginal revenue (MR), marginal cost (MC), average total cost (ATC), and profits ($\pi$). The diagram illustrates how market power yields profits through higher prices and lower costs.
Profit Maximization with Market Power in Math

Profits are maximized at $Q^*$ such that $MR = MC$. What are $Q^*$ and $P^*$?

Use these three steps:

1. Find $MR$
   - If you have a linear demand curve, you can find $MR = a + 2bQ$
   - where $b$ is the slope of the inverse demand curve
   - $a$ is the y-intercept
   - Remember that the inverse demand curve is $P = f(Q)$

2. Set $MR = MC$

3. Find price from demand curve
Profit Maximization with Market Power in Math

Profits are maximized at \( Q^* \) such that \( MR = MC \). What are \( Q^* \) and \( P^* \)?

Use these three steps:

1. Find \( MR \)
   - If you have a linear demand curve, you can find \( MR = a + 2bQ \)
   - where \( b \) is the slope of the inverse demand curve
   - \( a \) is the y-intercept
   - Remember that the inverse demand curve is \( P = f(Q) \)

2. Set \( MR = MC \)

3. Find price from demand curve

Do not confuse \( MC \) curve with true supply curve, which is independent of demand.
Try it Yourself: Roofer Market Power

Suppose the local roofing company has market power and faces the demand curve $Q = 200 - P/10$, where $Q$ is the number of roof jobs, and $P$ is in dollars. The marginal cost for the firm is $MC = 200 + 16Q$.

1. What is marginal revenue?
2. What is the profit maximizing output?
3. Price?
   And at home, you can try...
4. If the firm’s demand changes to $Q = 3500/3 - P/12$, what is the new marginal revenue?
5. Profit maximizing output?
6. Price?
How a Firm with Market Power Reacts to Market Changes
Three Changes

1. Change in marginal cost
2. Outward shift in demand
3. Rotation of demand curve
Competitive Market and an Increase in $MC$

What happens to the equilibrium price and quantity?
What happens to the equilibrium price and quantity?

- Supply curve shifts inward
- If supply is elastic, curve just shifts up
- Price increases
- Equilibrium $Q$ declines
Competitive Market and an Increase in $MC$

What happens to the equilibrium price and quantity?

- Supply curve shifts inward
- If supply is elastic, curve just shifts up
- Price increases
- Equilibrium $Q$ declines
- In the long run, cost increases fully passed along to consumers
Market Power and an Increase in \( MC \)

Review: Where is profit maximizing \( Q \)?
Market Power and an Increase in $MC$

Review: What is Profit Maximizing $P$?
Market Power and an Increase in $MC$

Draw an Increase in $MC$?
Market Power and an Increase in \( MC \)

What are New Profit Maximizing \( P \) and \( Q \)?
Market Power and an Increase in $MC$

Prices Increase, Quantity Falls

![Graph showing market power and increases in marginal costs](image-url)
$P$ and $Q$ and Outward Shift in Demand

What Does an Increase in Demand Look Like?
$P$ and $Q$ and Outward Shift in Demand

Where is the New $MR$?
$P$ and $Q$ and Outward Shift in Demand

Where is the New $Q$?
$P$ and $Q$ and Outward Shift in Demand

Where is the New $P$?
\( P \) and \( Q \) and Outward Shift in Demand

\( Q \) increases, \( P \) increases
Rotation of the Demand Curve: Perfect Competition

With $P$ Constant, Rotate Demand Curve
Rotation of the Demand Curve: Perfect Competition

No Response in $P$ or $Q$

In a perfectly competitive market

- supply exists independently of demand
- firm supply curve is a subset of the marginal cost curve
No Supply Curve for Firms with Market Power

In a perfectly competitive market
- supply exists independently of demand
- firm supply curve is a subset of the marginal cost curve

In a world with market power
- profit maximizing $P$ and $Q$ depend on demand
- to calculate producer surplus, rely on marginal cost curve
- this still tells us about the firm’s ability to produce more cheaply than it sells
Producer and Consumer Surplus with Market Power

Where is the Profit Maximizing $P$ and $Q$?
Producer and Consumer Surplus with Market Power

Where are the Trades that Don’t Take Place?
Producer and Consumer Surplus with Market Power

Where is $PS$?
Producer and Consumer Surplus with Market Power

Where is $CS$?
Producer and Consumer Surplus with Market Power

Consumers Worse Off, Producers Better Off

Graph showing the relationship between price (P), quantity (Q), consumer surplus (CS), producer surplus (PS), deadweight loss (DWL), marginal revenue (MR), marginal cost (MC), and equilibrium quantities (Q*, Q**). The graph illustrates how market power affects producer and consumer surplus, with consumers worse off and producers better off compared to perfect competition.
Government’s Role
In the Presence of Market Power
A Role for Government

Economists believe that may be a role for government to improve efficiency if the market is not perfectly competitive.

- Direct price regulation
- Antitrust
- Granting monopolies: patents and copyright
Direct Price Regulation for Natural Monopolies

- Recall that whether a firm is a natural monopoly depends on its cost structure
- \textit{ATC are always decreasing}
- When technology changes, cost structure may change
Direct Price Regulation for Natural Monopolies

- Recall that whether a firm is a natural monopoly depends on its cost structure
- \( ATC \) are always decreasing
- When technology changes, cost structure may change

At different points in time, these industries are or have been natural monopolies:

- telephone service
- public transit
- electricity distribution
- water and sewer services
Direct Price Regulation for Natural Monopolies

- Recall that whether a firm is a natural monopoly depends on its cost structure
- \( ATC \) are always decreasing
- When technology changes, cost structure may change

At different points in time, these industries are or have been natural monopolies:
- telephone service
- public transit
- electricity distribution
- water and sewer services
How to Set the Regulated Price?

- With a true natural monopoly, it’s most efficient to have only one firm in the market
- But might charge monopoly price
- \( \rightarrow \) government price regulation
- Government cannot set a price below ATC, even if this is the perfectly competitive price. Why?
How to Set the Regulated Price?

• With a true natural monopoly, it’s most efficient to have only one firm in the market
• But might charge monopoly price
• → government price regulation
• Government cannot set a price below ATC, even if this is the perfectly competitive price. Why?
• Because the firm would go out of business!
How to Set the Regulated Price?

• With a true natural monopoly, it’s most efficient to have only one firm in the market
• But might charge monopoly price
• → government price regulation
• Government cannot set a price below \( ATC \), even if this is the perfectly competitive price. Why?
• Because the firm would go out of business!
Recap of Today

- Market power
- Market power and marginal revenue
- Market power and profit maximization
- Reaction to market changes
- Welfare
- The role of government
