# Vanilla market.

Step 1

Step 2

Step 3

Step 4

Step 5

1. List the factors that influence demand. Choose a product market and give examples of each of these factors for that market. (We do not go over these factors for supply, but you would be well-advised to know them.)

1. Price.
2. Number of consumers.
  - # of customers wanting a product
3. Income or wealth.
4. Availability of substitutes.
5. Consumer tastes

2. Choose a market and give an example of a factor that would shift the demand curve and a factor that would shift the supply curve.

3. How does a consumer perceive a change in the price of beer due to an increase in the cost of manufacturing aluminum cans: as a shift in the demand curve, or a movement along the demand curve?

Suppose that the supply of steel is given by  $Q_S = 15P$ , and that the demand for steel is given by  $Q_D = 10,000 - 25P$ .

(a) What is the current equilibrium price and quantity?

Eqbm is when

$$Q_S = Q_D$$

$$15P = 10,000 - 25P$$

$$40P = 10,000$$

$$4P = 1,000$$

$$P = 250$$

$$Q_S = 15P$$
$$= 15(250)$$

$$Q_S = 3750$$

$$Q_D = 10000 - 25P$$

$$Q_D = 3750$$

Suppose that the supply of steel is given by  $Q_S = 15P$ , and that the demand for steel is given by  $Q_D = 10,000 - 25P$ .

(b) Suppose that steel is imported and that the government imposes tariffs of \$100 per unit. What is the new supply curve? (Hint: the  $P$  of supplying each unit increases by 100; re-write the supply curve in terms of  $P$  and add 100.)

$$\begin{array}{r} Q_S = 15P \\ \hline 15 \end{array}$$

$$P = Q_S / 15 \leftarrow \text{orig supply, in terms of } P$$

$$P_{\text{new}} = P_{\text{orig}} + 100$$

$$P_{\text{new}} = \frac{Q_S}{15} + 100$$

(c) Without doing any algebra, what do you anticipate should happen to price and quantity after the introduction of the tariff? Draw a diagram to illustrate what is going on.

(d) What is the new equilibrium price and quantity?
